WHAT DOES THE GTAB COVER?

The Adult Solid Tumour GTAB brings clinicians and scientists together to interpret complex genomic results and inform targeted treatment.

- Expert recommendations for large panel results
- Classification of somatic variants
- Identification of actionable alterations and potential therapies
- Consideration of potential inherited risk and referral to Clinical Genetics

WHEN TO REFER?

Cases may be referred when:

- A complex genomic result requires multidisciplinary interpretation
- An actionable alteration could affect treatment
- Somatic testing indicates a potential inherited risk

HOW TO REFER?

- Complete the [GTAB referral form](#).
- Email the completed form to the GTAB inbox with the patient's genomic report and relevant pathology reports.
- Attendance by someone from the referring clinical team is strongly encouraged.
- **Please note:** *EPIC users: please continue sending referrals to the GTAB inbox.*

WGS CASES

WGS cases are automatically referred to the GTAB and do not require a separate referral form.

OUTCOMES

A formal GTAB outcome form is completed after the meeting and sent to the referring clinical team.
